WARTS HURT.

The Remy Class IV Laser Wart Removal System Doesn't.

Plantar Warts are Often Difficult & Painful to Remove.

UNTIL NOW.

"I tried everything. Nothing worked and the warts just started spreading to my other toes.

That's when I heard about The Remy.

After a few painless treatments, I am finally wart-free and they have not resurfaced."

The **Science** Behind Class IV Laser Therapy

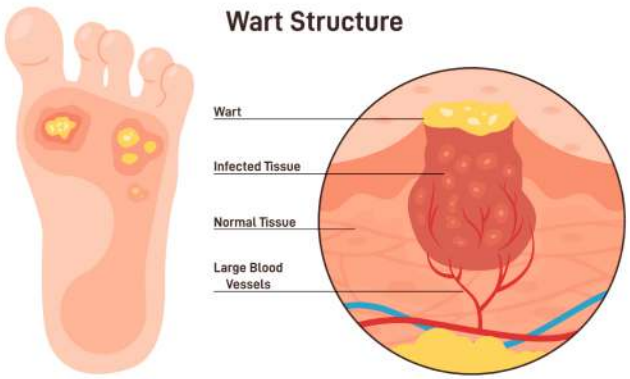

The Remy Class IV Laser uses a coagulation method for removal of plantar / mosaic warts.

When the laser interacts with the skin, it attacks the blood vessels within that "feed" the wart.

Without a steady blood supply, the wart will dry out and fall off.

Additionally, when our body's cells absorb the light, studies have shown an **increase in neutrophils generation** (white blood cells that fight infections.)

These white blood cells create **a crucial line of defense against virus that causes warts.**

Advantages of Class IV Laser Therapy for **Warts (HPV)**

Warts on the bottom of your feet (plantar wart) might be initially mistaken for calluses; however, **they usually become much more painful and begin to spread, becoming a cluster of warts.**

Additionally, **warts are highly contagious.** Therefore, if left untreated, it can spread to members of the family who share areas where it is normal to go barefoot (i.e. home bathroom, carpets, pools, etc.)

Wart removal is not only challenging, but it is often painful. **With The Remy Laser, we can rid plantar warts without pain.**

Plus, this method of wart removal **does not leave any open wound, therefore scarring is less likely.**

Lasers stimulate our immune systems, which is critical to fight the virus that causes warts: the human papillomavirus (HPV).

Individuals with diabetes are more susceptible to warts due to compromised immune systems.

Patient **FAQs** About Class IV Laser Therapy

Q: How Long Does it Take to See Improvement to Remove a Wart?
A: Each wart is different. Treatments will depend on how long the wart has been growing and how much it has spread; however, the average amount of office visits to rid a wart infection and/or a cluster of warts is usually five to six.

Q: What is the difference between a Class IV Laser and a CO2 Laser for wart removal?
A: The biggest difference for patients is comfort during and after the procedure. A CO2 laser requires a local anesthetic to keep pain levels down, while The Remy does not. Treatment is completely needle-free. Plus, there is no post-treatment pain or activity restrictions when using class IV lasers vs. a CO2 laser.

Q: Will my wart(s) come back?
A: It is not likely that warts will reoccur after a successful treatment process; at least not in the same spot. But, because warts are caused by a virus, it is possible for new warts to appear in different areas of the foot. Immune system stimulation from the Class IV Laser does help to lessen this probability.
